

Supplementary Diagnostics for Robust Low-Thrust Cislunar Maneuver Initialization Under Missed-Thrust Events

Anonymous Author

Purpose

This supplement preserves figure-only diagnostics that are secondary to the main manuscript’s claim hierarchy. The main paper reports the tables, statistics, and claim-to-artifact map; the figures here support visual inspection of selected diagnostics without changing the recorded data values.

Teacher-Controlled Diagnostics

Figure 1: Teacher-controlled selected-branch refinement success rates. The result demonstrates nonzero recovery success but not quantum advantage.

Catalog-Derived Feasibility Diagnostic

Artifact Pointer

The machine-readable manifest `../data/results/artifact_manifest.json` records hashes for the manuscript, supplement, source code, generated tables, figures, and result artifacts. It excludes itself, virtual environments, caches, logs, and LaTeX auxiliary files.

Figure 2: Teacher-controlled nominal and recovery fuel summaries. Fuel differences must be interpreted together with feasibility and missed-thrust error.

Figure 3: Example trajectory from the teacher-controlled benchmark. The case is a normalized CR3BP algorithm benchmark, not a flight-ready trajectory.

Figure 4: Feasibility sweep heatmap for the catalog-derived benchmark. The completed cases remain outside the configured robust success thresholds.
